

### **Progesterone**

To help determine the cause of infertility, track ovulation, help diagnose an ectopic or failing pregnancy, monitor the health of a pregnancy, monitor progesterone replacement therapy, or help diagnose the cause of abnormal uterine bleeding.

### **Prolactin**

To determine whether your prolactin levels are higher (or occasionally, lower) than normal.

### **Prostate Specific Antigen (PSA)**

PSA is a substance produced by the prostate gland. Elevated PSA levels may indicate prostate cancer or a non-cancerous condition such as prostatitis or an enlarged prostate.

### **Pro-Time / INR**

Pro-Time is a blood test that measures how long it takes the blood to clot. A pro-time (pro-thrombin time) test can be used to screen for bleeding abnormalities. PT is also used to monitor treatment with medication that prevents the formation of blood clots.

### **Renal Function Panel**

This panel provides an assessment of your kidney functions to determine your risk of kidney disease and your general state of nutrition.

### **Rheumatoid RA Factor**

Diagnose rheumatoid arthritis and Sjögren syndrome.

### **Rubella IgG titer**

Confirms the presence of adequate protection against the Rubella virus. Can also be used to detect a recent or past infection.

### **TB Quantiferon Gold**

This is an innovative blood test that measures the cell-mediated immune response of TB-infected individuals. The test has several advantages over a TB skin test. The test only requires one visit. The results are unaffected by BCG vaccination. The results are unaffected by most environmental non-tuberculosis mycobacterium.

### **Testosterone Free and Total**

Free testosterone is a term that refers to the amount of testosterone in the bloodstream. Usually tested in males with certain medical conditions.

### **Testosterone Level Total**

Detects an abnormal testosterone level in males and females. It may be used to help diagnosis infertility, premature or delayed puberty, to diagnose the cause of masculine physical features in females, or polycystic ovary syndrome.

### **T3 Free**

Measures the amount of T3 (the active form of the hormone) available to the cells and tissues.

### **T3 Total**

A T3 test helps to determine whether the thyroid is functioning properly, and also monitors the progress of a patient with a known thyroid disorder.

### **T4 Free**

Evaluates the amount of T4 available to the cells and tissues.

### **T4 Total**

The T4 test helps evaluate thyroid gland function and helps diagnose hypothyroidism or hyperthyroidism.

### **Thyroid Stimulating Hormone (TSH)**

The TSH blood test is used to check for thyroid gland problems. TSH is produced when the hypothalamus releases a substance called thyrotropin-releasing hormone (TRH). TRH then triggers the pituitary gland to release TSH.

### **Uric Acid Test**

Detects high levels of uric acid in the blood, which could be a sign of the condition gout or to monitor uric acid levels when undergoing chemotherapy or radiation treatment.

### **Urinalysis**

The urinalysis is used as a screening and/or diagnostic tool because it can help detect substances or cellular material in the urine associated with different metabolic and kidney disorders.

### **Urine Culture**

A urine culture is a test that can detect bacteria in your urine. This test can find and identify the germs that cause a urinary tract infection (UTI).

### **Varicella IgG titer**

Confirms the presence of adequate protection against the Varicella (Chickenpox) virus. Can also be used to detect a recent or past infection.

### **Vitamin B-12**

A B12 test is primarily ordered to help diagnose the cause of macrocytic anemia. The test is ordered as a follow-up test when large RBCs and a decreased hemoglobin concentration are found during a CBC test.

### **Vitamin D 25- Hydroxy**

Determines if bone weakness, bone malformation, or abnormal metabolism of calcium is occurring as a result of a deficiency or excess of vitamin D.

**Salem Office: 618-548-3878**  
**Centralia Office: 618-532-6518**

### **Acute Hepatitis Panel**

Can be used to detect infection with Hepatitis A, B, or C.

### **Alkaline Phosphatase Isoenzyme**

Alkaline phosphatase (ALK) is a substance found in all body tissues. There are many different forms of it. Each type of ALK is different and is called an isoenzyme. The isoenzyme test will show where in the body the ALK is different and is called an isoenzyme. The isoenzyme test will show where in the body the ALK is being produced, such as from the liver or the bones.

### **Amylase**

To diagnose and monitor pancreatitis or other pancreatic diseases.

### **Antinuclear Antibody ANA**

Used to screen for certain autoimmune disorders, such as systemic lupus erythematosus and polymyositis.

### **C-Reactive Protein (CRP)**

The CRP serves as a general marker for infection and inflammation, alerting your doctor that further testing and treatment may be necessary.

### **Complete Blood Count (CBC)**

A complete blood count provides important information about the kinds and numbers of cells in the blood, especially red blood cells, white blood cells, and platelets. A CBC helps your health professional evaluate symptoms (such as weakness, fatigue, or bruising) and diagnose conditions (such as anemia, infection, and many other disorders.)

### **Comprehensive Metabolic Profile (CMP)**

The CMP is used as a broad screening tool to evaluate organ function and check for conditions such as diabetes, liver disease, and kidney disease. The CMP may also be ordered to monitor known conditions, such as hypertension, and to monitor patients taking specific medications for any kidney- or liver-related side effects.

### **Creatine Kinase (CK)**

To detect and monitor muscle damage; to help diagnose conditions associated with muscle damage; sometimes to help determine if you have had a heart attack, although for heart attack detection, this test has been largely replaced by troponin.

### **Erythrocyte Sedimentation Rate (ESR)**

The ESR is an easy, nonspecific test that has been used for many years to help diagnose conditions associated with acute and chronic inflammation including infections, cancers, and autoimmune diseases.

### **Estrogen Fractionated**

This test is used to detect a deficiency or excess of the estrogen hormones "Estradiol" and "Estrone" in a woman and to help diagnose a variety of conditions associated with this imbalance. In a man the test may be used to detect an excess of these estrogen hormones and its cause.

### **Ferritin**

The ferritin test is ordered to assess a person's iron stores in the body.

### **Folic Acid**

A folic acid test measures the amount of folic acid in the blood. Folic Acid is a B vitamin.

### **Follicle Stimulating Hormone**

To evaluate your pituitary function, especially as it relates to fertility issues, gonadal failure, maturation concerns, or pituitary tumors.

### **GHP3**

The GHP3 includes results from the Complete Blood Count (CBC), Lipid, Thyroid Stimulating Hormone (TSH), T4 and the Comprehensive Metabolic Profile (CMP).

### **Hepatitis A Antibody Total**

Hepatitis A antibodies remain present for many years after infection or immunization, and protect you against further infection by the hepatitis A virus.

### **Hepatitis A Antibody IgM**

Hepatitis A is the first antibody produced by the body when it is exposed to hepatitis A. The Hepatitis A IgM test is used to screen for early detection of infection and is used to diagnose the disease in a patient with evidence of acute hepatitis.

### **Hemoglobin A1C**

The A1C test is used primarily to monitor the glucose control of diabetics over time. The goal of those with diabetes is to keep their blood glucose levels as close to normal as possible.

### **Hepatitis B Core AbIgm**

The Hep B Core Ab IgM positivity indicates recent infection with Hepatitis B virus, usually within the last 6 months. Its presence indicates acute infection.

### **Hepatitis B Core Ab Total**

Can be used to help detect acute and chronic HBV infections; it is produced in response to the core antigen and usually persists for life.

### **Hepatitis B Surface Antibody (HepBsAB HBV)**

The Hepatitis B Surface Antibody (HBsAb) confirms the presence of adequate protection against the Hepatitis-B virus. Can also be used to detect a recent or past infection.

### **Hepatitis B Surface Antigen**

The Hep B Surface Antigen is a serologic marker on the surface of Hepatitis B virus. It can be detected in high levels in serum during acute or chronic hepatitis. The presence of HBsAg indicates that the person is infectious.

### **Hepatitis C Antibody**

The Hepatitis C AB IgG is a screening test for hepatitis C. Positivity indicates that antibodies to Hepatitis C virus were detected in the blood.

### **Hepatitis C RNA by PCR Qualitative**

To diagnose a hepatitis C virus (HCV) infection and to monitor treatment of the infection.

### **Herpes Simplex Virus (HSV)**

### **Types 1 & 2 IgG and IgM Antibody**

The presence of HSV-1 or HSV-2 IgG antibodies indicates a previous infection. The presence of HSV-1 or HSV-2 IgM antibodies indicates an active or recent infection.

### **Iron Panel**

Includes serum iron which measures the level of iron in the blood.

TIBC which measures all of the proteins in the blood that are available to bind with iron. Ferritin which reflects the amount of stored iron in the body and transferrin. The body produces transferrin in relationship to the need for iron. When iron stores are low, transferrin levels increase and vice versa.

### **LDH (Lactate Dehydrogenase)**

LDH is an enzyme found in almost all of the bodies cells and is released from cells into the fluid portion of blood when cells are damaged or destroyed, thus it is a general indicator of tissue and cellular damage.

### **Lipase**

To diagnose and monitor pancreatitis or other pancreatic diseases.

### **Lipid Profile**

The Lipid Panel is a group of tests that are often ordered together to determine risk of coronary heart disease. The panel typically includes: Total Cholesterol, High Density Lipoprotein Cholesterol (HDL-C, good cholesterol), Low Density Lipoprotein Cholesterol (LDL-C, bad cholesterol), and Triglycerides.

### **Liver Profile**

A liver (hepatic) function panel is a blood test used to evaluate how the liver is working. High or low levels may mean that liver damage or disease is present.

### **Magnesium**

Used to evaluate the level of magnesium in your blood and to help determine the cause of abnormal calcium and/or potassium levels.

### **Measles IgG titer**

Confirms the presence of adequate protection against the Measles virus. Can also be used to detect a recent or past infection.

### **Micro-albumin Urine with Creatinine**

Albumin is a major protein normally present in blood. The urine albumin test detects and measures the amount of albumin in the urine. The presence of a small amount of albumin in the urine may be an early indicator of kidney disease. Checking urine creatinine levels may help evaluate the health of your kidneys or to help diagnose kidney disease or to monitor treatment for kidney disease.

### **Mumps IgG titer**

Confirms the presence of adequate protection against the Mumps virus. Can also be used to detect a recent or past infection.

### **Parathyroid Hormone**

The presence Parathyroid Hormone is ordered to help diagnose the reason for a low or high calcium level and to help distinguish between parathyroid-related and non-parathyroid-related causes. It may also be ordered to monitor the effectiveness of treatment when a patient has a parathyroid-related condition.

### **Phosphorus Level**

Evaluates the level of phosphorus in your blood and to aid in the diagnosis of conditions known to cause abnormally high or low levels.
